

FlightPath Data

Simple Preboarding Data File Automation

Control spend and mitigate risk with the leading tool for tabular data preboarding.

Automate file handling

In the past, DataOps teams jury-rigged custom tools to handle data partnerships one by one with little consistency. FlightPath makes that complexity a thing of the past.

FlightPath boosts the productivity of DataOps teams by providing an easy-to-use automation development and management environment that is 100% purpose-built to make adding a high-value preboarding stage to data ingestion a snap.

There is no architecture or process design work. And FlightPath makes the development and automation of data quality as predictable as the processes themselves.

A control panel for higher efficiency

FlightPath enables you to scale down your investment in fire-fighting and manual workflows. Reactive workflows can eat half of your DataOps team's time as they try to understand what just happened.

FlightPath identifies, validates, upgrades, and publishes data to downstream consumers using the open source CsvPath Framework. With an internal trusted publisher and complete immutable traceability, your incidents per unit-revenue drops while remediation time is dramatically improved. This is the power of data preboarding.

Scalable and definitive quality control

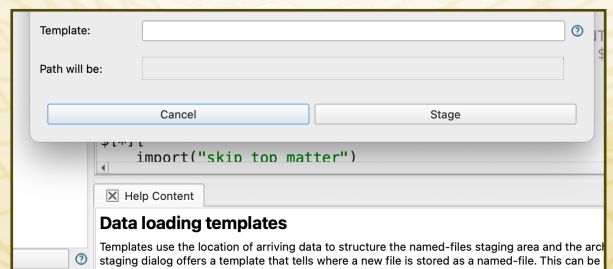

Landing data from many data partners regularly with quality doesn't have to be so hard. Without FlightPath, DataOps integrations are one-offs based on learnings that quickly get lost. Standardizing the data partnership preboarding process allows you to assure data published into the data lake, analytics and applications is trustworthy. At the same time you add trust, the additional consistency unlocks team productivity.

Cloud-ready observability

FlightPath is pre-integrated with OpenTelemetry and OpenLineage, unlocking high quality observability using dozens of industry-leading tools. Sending your onboarding automation indicators to tools like DataDog, Splunk, and Grafana is a button-click away.

Designed for the open CsvPath Framework.
